|------------------------------------------------------------------------------|------|
| PREFACE                                                                      | vii  |
| PREREQUISITIES                                                               | viii |
| CONVENTIONS AND NOTATIONS                                                    | ix   |
| INTRODUCTION AND OVERVIEW                                                    | 1    |
| <b>Chapter 1</b> SOME ELEMENTARY RESULTS                                     | 11   |
| 1. Remarks on logical notation and boolean algebras                          | 11   |
| 2. Elementary facts on structures                                            | 13   |
| 3. O-minimal structures                                                      | 16   |
| 4. O-minimal ordered groups and rings                                        | 19   |
| 5. Model-theoretic structures                                                | 21   |
| 6. The simplest o-minimal structures                                         | 24   |
| 7. Semilinear sets                                                           | 25   |
| Notes and comments                                                           | 29   |
| <b>Chapter 2</b> SEMIALGEBRAIC SETS                                          | 31   |
| 1. Thom's lemma and continuity of roots                                      | 31   |
| 2. Semialgebraic cell decomposition                                          | 33   |
| 3. Thom's lemma with parameters                                              | 38   |
| Notes and comments                                                           | 41   |
| <b>Chapter 3</b> CELL DECOMPOSITION                                          | 43   |
| 1. The monotonicity theorem and the finiteness lemma                         | 43   |
| 2. The cell decomposition theorem                                            | 49   |
| 3. Definable families                                                        | 59   |
| Notes and comments                                                           | 61   |
| <b>Chapter 4</b> DEFINABLE INVARIANTS:<br>DIMENSION AND EULER CHARACTERISTIC | 63   |
| 1. Dimension                                                                 | 63   |
| 2. Euler characteristic                                                      | 69   |
| Notes and comments                                                           | 77   |
| <b>Chapter 5</b> THE VAPNIK-CHERVONENKIS PROPERTY IN<br>O-MINIMAL STRUCTURES | 79   |
| 1. A combinatorial dichotomy                                                 | 79   |
| 2. Vapnik-Chervonenkis classes and dependence                                | 81   |
| 3. Reduction to the case $q = 1$                                             | 85   |
| Notes and comments                                                           | 91   |

|                   |                                                              |            |
|-------------------|--------------------------------------------------------------|------------|
| <b>Chapter 6</b>  | <b>POINT-SET TOPOLOGY IN O-MINIMAL STRUCTURES</b>            | <b>93</b>  |
|                   | 1. Curve selection                                           | 93         |
|                   | 2. Fiberwise properties                                      | 98         |
|                   | 3. Paths and partitions of unity                             | 100        |
|                   | 4. Curves, proper maps, and identifying maps                 | 102        |
|                   | Notes and comments                                           | 106        |
| <b>Chapter 7</b>  | <b>SMOOTHNESS</b>                                            | <b>107</b> |
|                   | 1. Differentiability in ordered fields                       | 107        |
|                   | 2. Inverse function theorem                                  | 109        |
|                   | 3. Definable maps are piecewise $C^1$                        | 114        |
|                   | 4. Existence of good directions                              | 117        |
|                   | Notes and comments                                           | 118        |
| <b>Chapter 8</b>  | <b>TRIANGULATION</b>                                         | <b>119</b> |
|                   | 1. Simplexes and complexes                                   | 119        |
|                   | 2. Triangulation theorem                                     | 127        |
|                   | 3. Definable retractions and definable continuous extensions | 134        |
|                   | Notes and comments                                           | 138        |
| <b>Chapter 9</b>  | <b>TRIVIALIZATION</b>                                        | <b>141</b> |
|                   | 1. Trivialization theorem                                    | 142        |
|                   | 2. Applications                                              | 149        |
|                   | 3. On a conjecture of Benedetti and Risler                   | 150        |
|                   | Notes and comments                                           | 154        |
| <b>Chapter 10</b> | <b>DEFINABLE SPACES AND QUOTIENTS</b>                        | <b>155</b> |
|                   | 1. Definable spaces                                          | 156        |
|                   | 2. Definable quotient spaces                                 | 161        |
|                   | Notes and comments                                           | 168        |
|                   | <b>HINTS AND SOLUTIONS</b>                                   | <b>169</b> |
|                   | <b>REFERENCES</b>                                            | <b>173</b> |
|                   | <b>INDEX</b>                                                 | <b>177</b> |
